

#### GENERAL INFORMATION

The Board of Commissioners conducts its public meetings twice per month in the Main Office Board Room at 8814 Main Street, Houma, Louisiana at 5:30 PM on the first and third Mondays of each month. Meetings may be re-scheduled or cancelled for conflicts or holidays as the Board of Commissioners deems necessary.

Water quality is tested throughout the year to adhere to strict guidelines and regulations set forth by Consolidated Waterworks District No. 1, the State of Louisiana Department of Health and the Federal EPA. Consolidated Waterworks is committed to serving safe clean water to all of its customers. The Environmental Protection Agency has mandated that community water systems annually inform their customers of the quality of water delivered by the system. Consolidated Waterworks District No. 1 is also required to inform you of certain risks and possible contaminants that may be contained in drinking water.

Consolidated Waterworks District No. 1 currently operates two independent water treatment plants distributing water to separate sections of Terrebonne Parish. Under certain emergency conditions, water may come from either plant. The primary difference between the two plants is the water source. Both plants utilize the coagulation, sedimentation, filtration, and disinfection process to treat the surface source water. Granular activated carbon and sand filters are utilized to filter water and adsorb many organic and some inorganic compounds. This adsorption process greatly enhances the water's taste and odor characteristics. Chlorine is the primary plant disinfectant. Chloramine disinfectant is injected prior to water entering the distribution system.

# INFORMATIONAL STATEMENTS and WARNINGS

- The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals, and in some cases, radioactive material, and can pick up substances resulting from the presence of animals or human activity.
- 2. Contaminants that may be present in source water include:
  - Microbial contaminants, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations and wildlife.
  - Inorganic contaminants, such as salts and metals, which can be naturally-occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.
  - Pesticides and herbicides, which may come from a variety
    of sources such as agriculture, urban stormwater runoff,
    and residential uses.
  - d. Organic chemical contaminants, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban stormwater runoff, and septic systems.
  - Radioactive contaminants, which can be naturally-occurring or the result of oil and gas production and mining activities.
- 3. In order to ensure that tap water is safe to drink, EPA prescribes regulations which limit the amount of certain contaminants in water provided by public water systems. FDA regulations establish limits for contaminants in bottled water which must provide the same protection for public health.
- 4. Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's Safe Drinking Water Hotline at 1-800-426-4791.
- 5. Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline at 1-800-426-4791.

- 6. Some people who drink water containg trihalomethanes or haloacetic acids in excess of the MCL over many years may experience problems with their liver, kidneys, or central nervous system and may have an increased risk of getting cancer.
- 7. If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing components. Consolidated Waterworks is responsible for providing high quality drinking water, but cannot control the variety of materials used in

plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using the water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at http://www.epa.gov/safewater/lead.

#### **WATER SOURCES**

#### **SCHRIEVER WATER TREATMENT PLANT:**

**PRIMARY:** Surface Water from Bayou Lafourche. The bayou runs from Donaldsonville, LA to the Gulf of Mexico. The bayou obtains most of its water from the Mississippi River @ Donaldsonville, LA.

#### **HOUMA WATER TREATMENT PLANT**

**PRIMARY:** Surface Water from Gulf Intracoastal Waterway (generally flows east/west along coastal Louisiana and other Gulf states: rain water runoff, Mississippi River influence, Atchafalaya River influence, and tidal water influence)

**SECONDARY:** Bayou Black (when the Intracoastal Canal becomes too salty: chlorides greater than 250 ppm)

**SOURCE WATER ASSESSMENT:** A source water assessment has been performed for both the Schriever & the Houma Water Treatment Plants. The reports and the area maps may be viewed at Consolidated Waterworks District No. 1's office at 8814 Main Street, Houma, LA

See Table on Reverse Side

### **DEFINITIONS:** to assist you in understanding the Consumer Confidence Report.

Maximum Contaminant Level Goal: MCI G: The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs

allow for a margin of safety.

Maximum Contaminant Level: The MCL: Maximum Contaminant Level: The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment

technology.

SCHRIEVER WATER TREATMENT SYSTEM

Maximum Residual Disinfectand Level: The highest level of a disinfectant MRDL:

allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants. Goal: The level of a drinking water disinfectant below which there is no

MRDLG: Maximum Residual Disinfectant Level

known or expected risk to health. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

Non Detected: An analytical sample N.D.: where the contaminant could not be detected by the method used by the

laboratory.

Parts per Million: One part per million corresponds to 1 minute in 2 years or a single penny in \$10,000.00 ppm:

ppb:

Parts per Billion: One part per billion corresponds to 1 minute in 2000 years or a single penny in \$10,000,000.00

pCi/L: Picocuries per Liter is a measure of

the radioactivity in water.

NTU: Nephelometric Turbidity Units: Is a

measure of the clarity of water. Turbidity in excess of 5 NTU is just noticeable to the average person.

Action Level: The concentration of a AL: contaminant that, if exceeded, triggers treatment or other requirements that a water system must follow.
